

Alaska Hatchery Research Program: Study Question 3: Relative Reproductive Success Update

Kyle Shedd
Gene Conservation Laboratory
Alaska Department of Fish and Game
BOF Hatchery Committee Meeting
March 23, 2022

Alaska Hatchery Research Program

- 1) What is the genetic structure of pink and chum in PWS and SEAK?
- 2) What is the extent and annual variability of straying?
- 3) What is the impact on fitness (productivity) of natural pink and chum stocks due to straying hatchery pink and chum salmon?

Hatchery/Natural Fitness

Steelhead

433

Differential reproductive success of sympatric, naturally spawning hatchery and wild steelhead trout (*Oncorhynchus mykiss*) through the adult stage

Average Reproductive Success

Stockdale 2014/2016

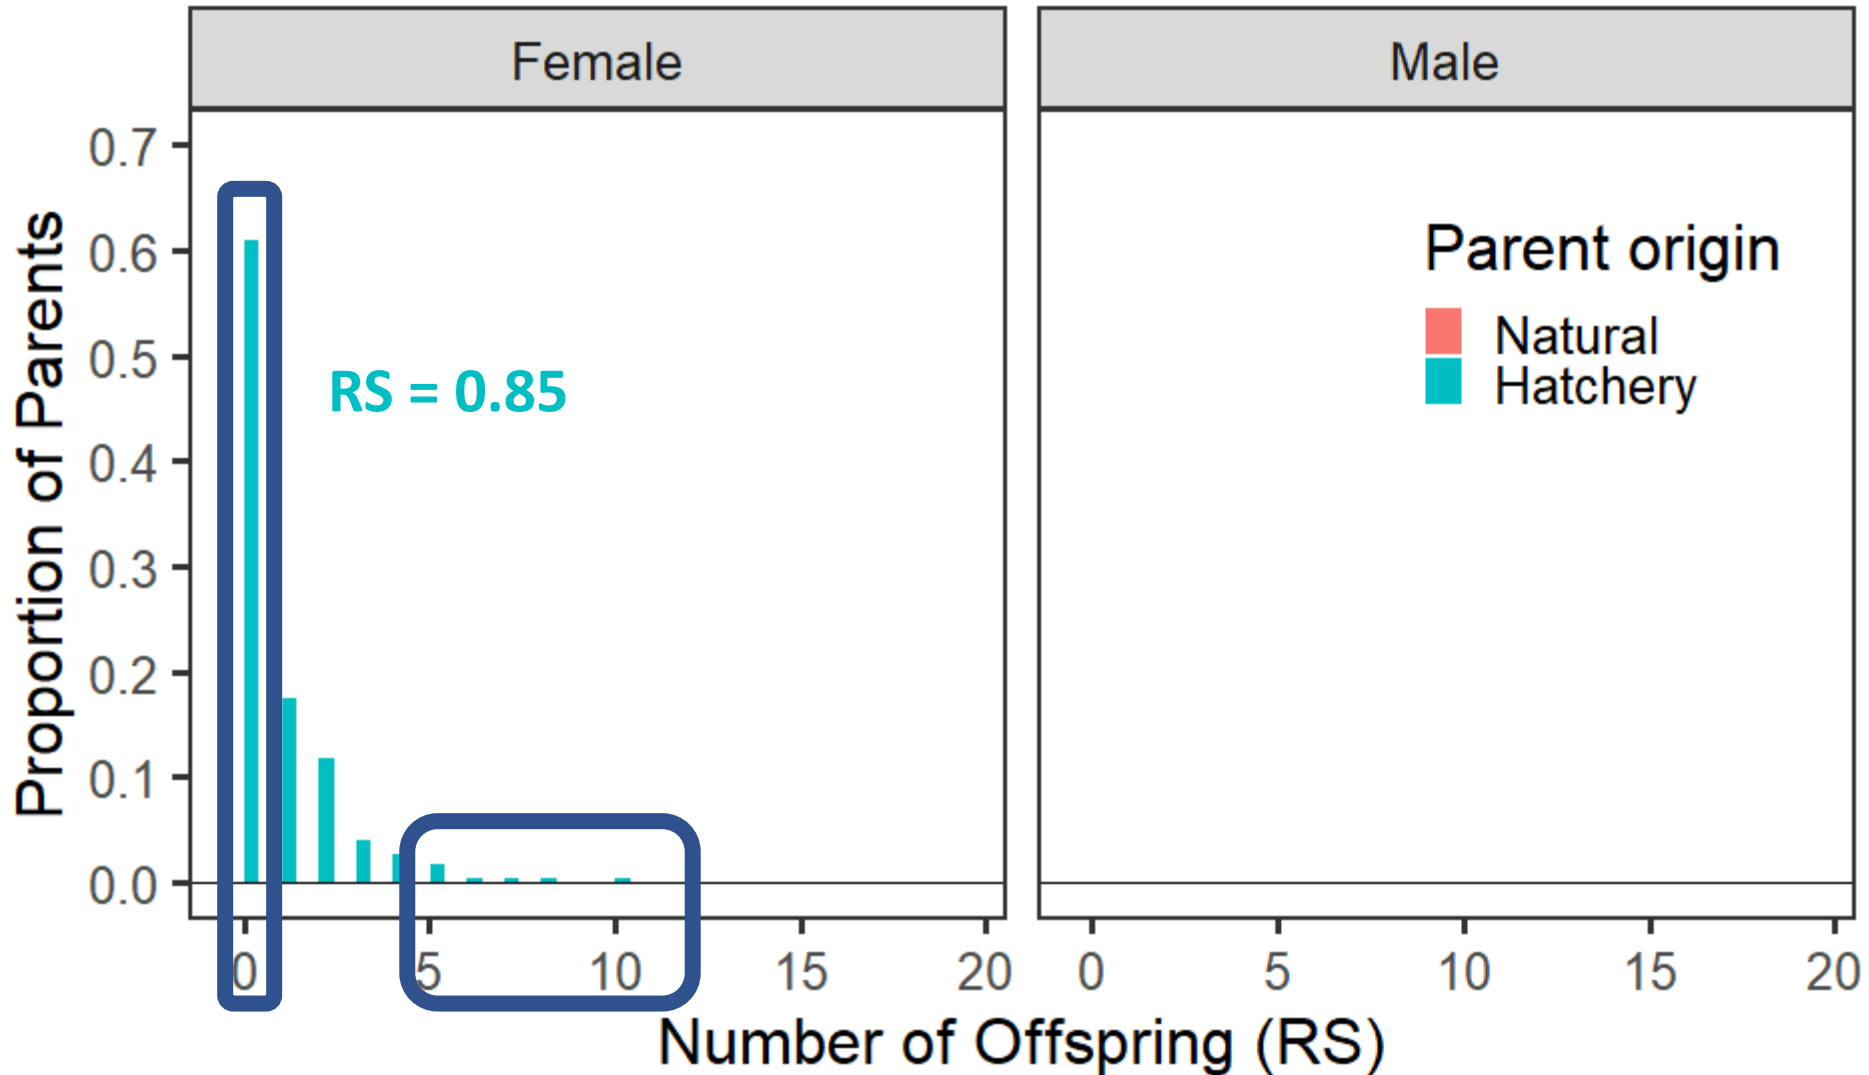

Female	2014	2016	Average RS	RRS
	Parents	Offspring		
Hatchery	230	196	0.85	= 0.42
Natural	221	448	2.03	

Male	2014	2016	Average RS	RRS
	Parents	Offspring		
Hatchery	206	177	0.86	= 0.28
Natural	137	417	3.04	

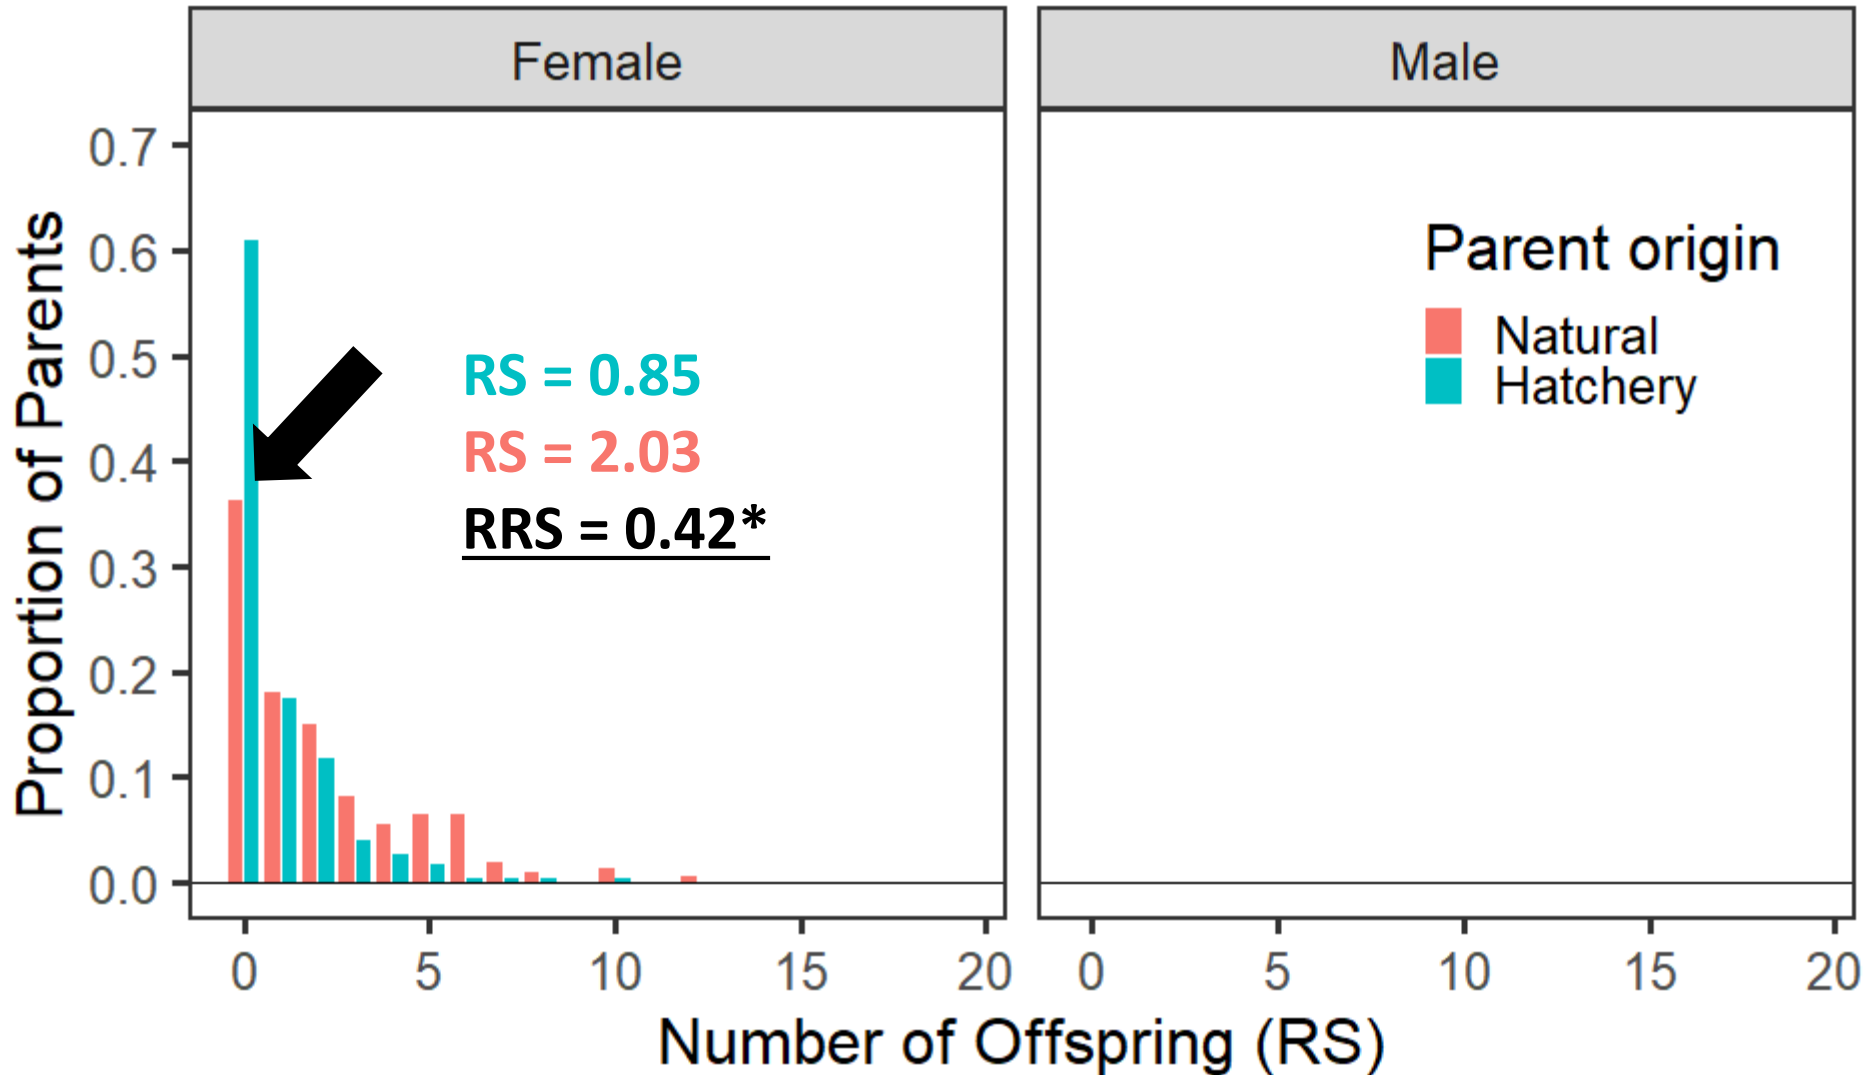

RS Distribution: Stockdale 2014/2016

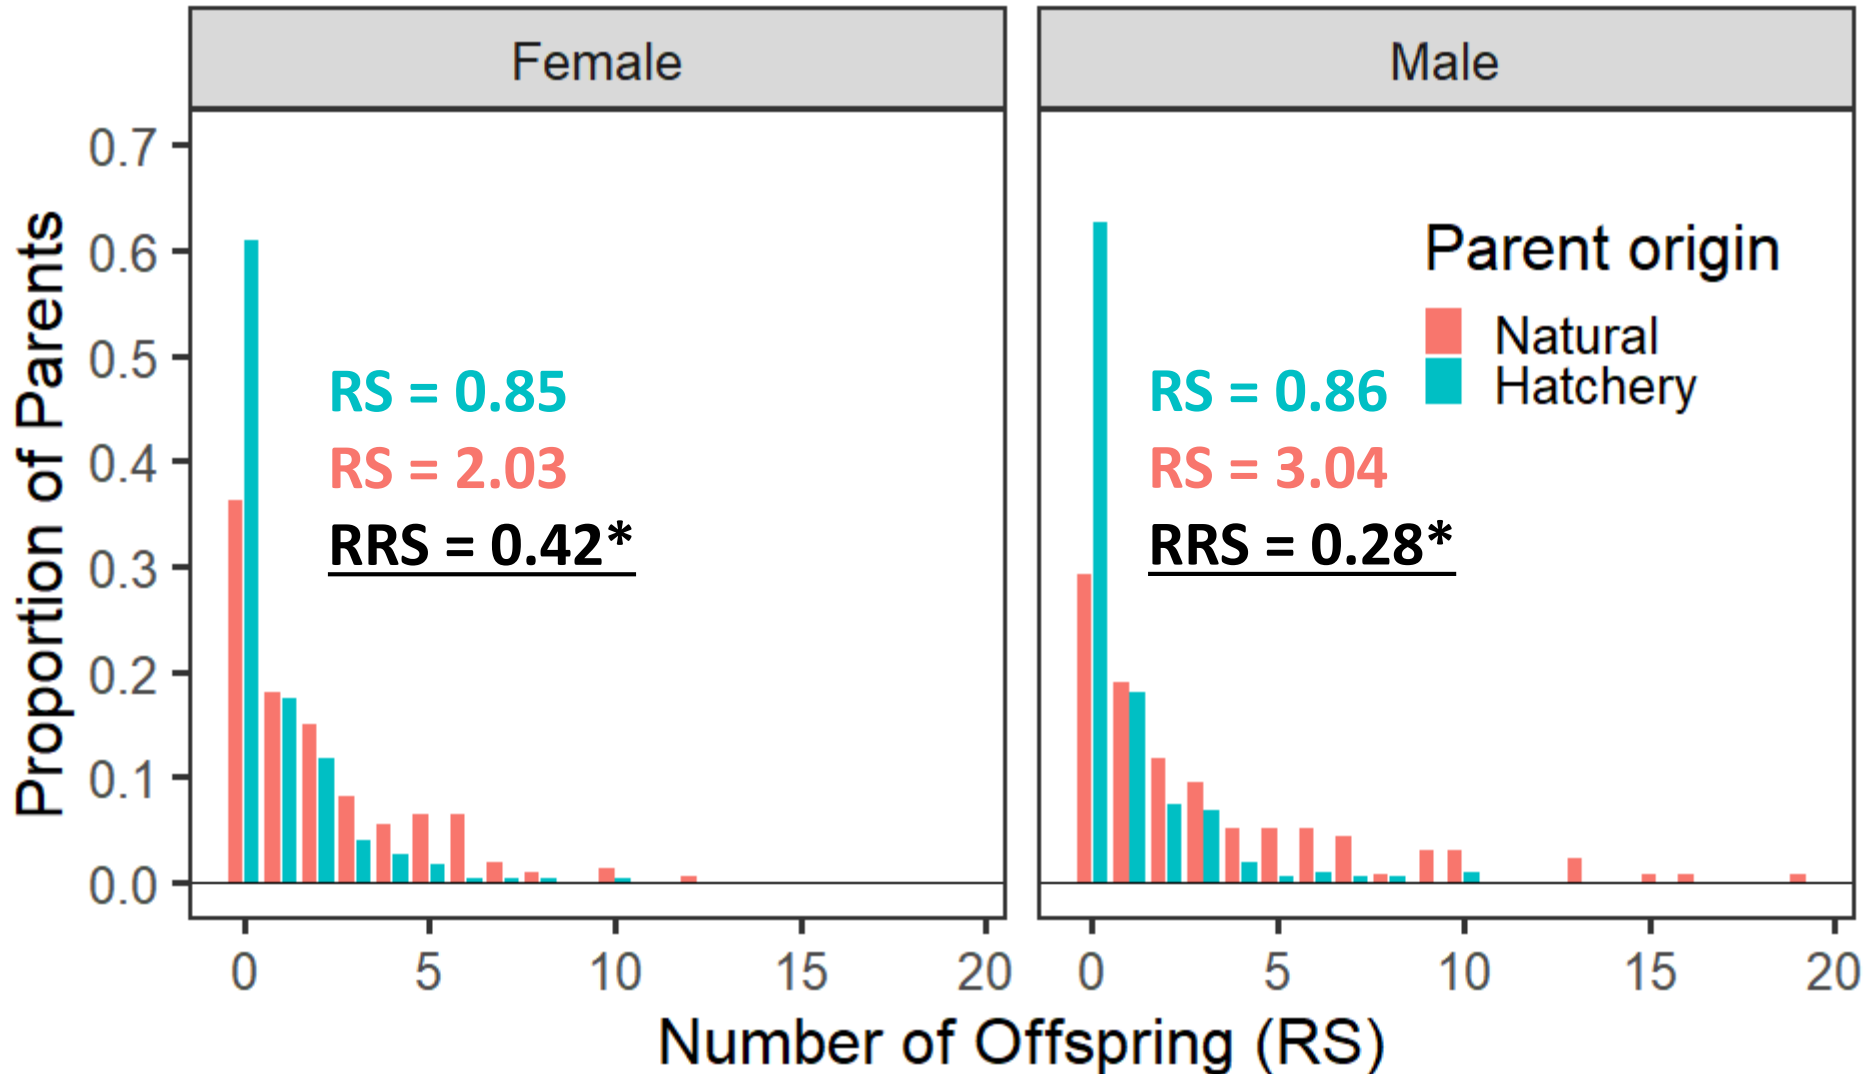

RS Distribution: Stockdale 2014/2016

RS Distribution: Stockdale 2014/2016

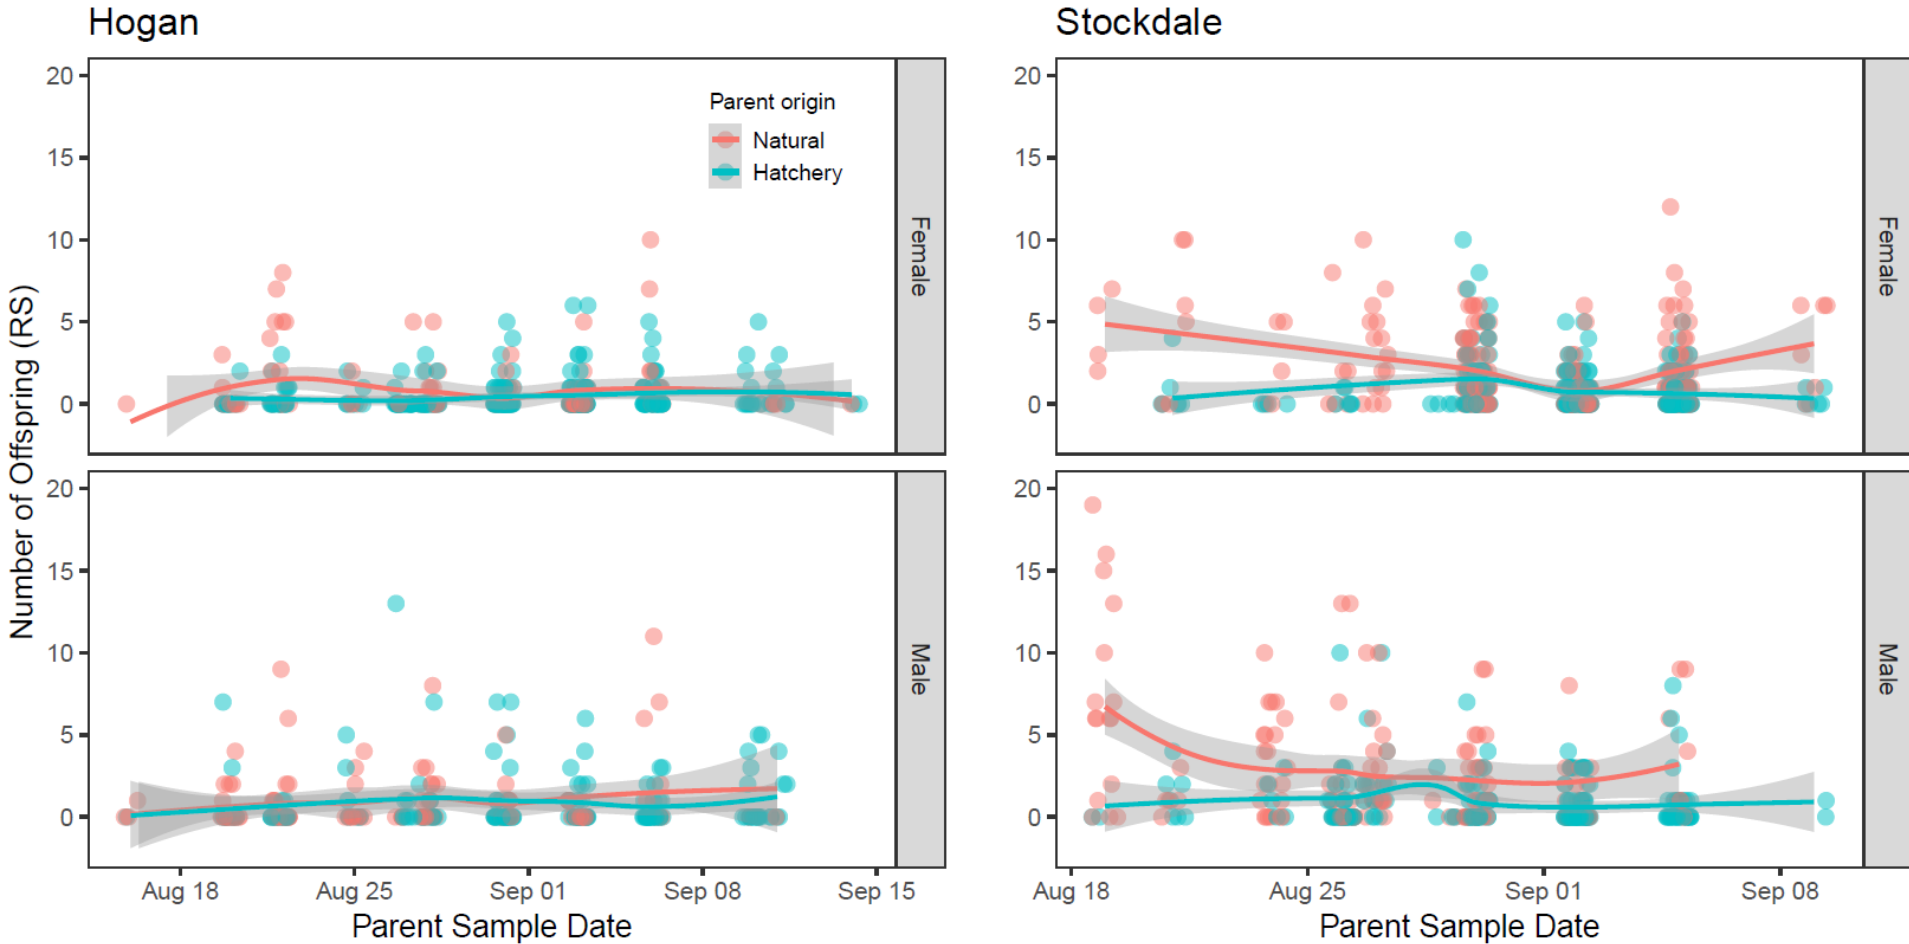

RS Distribution: Stockdale 2014/2016

Accounting for Phenotypic Differences

- Phenotypic differences between hatchery/natural
 - Body length
 - Sample date (run timing)
 - Sample location (within a stream)
 - Intertidal vs. freshwater spawners
- Correlated with number of offspring (RS)

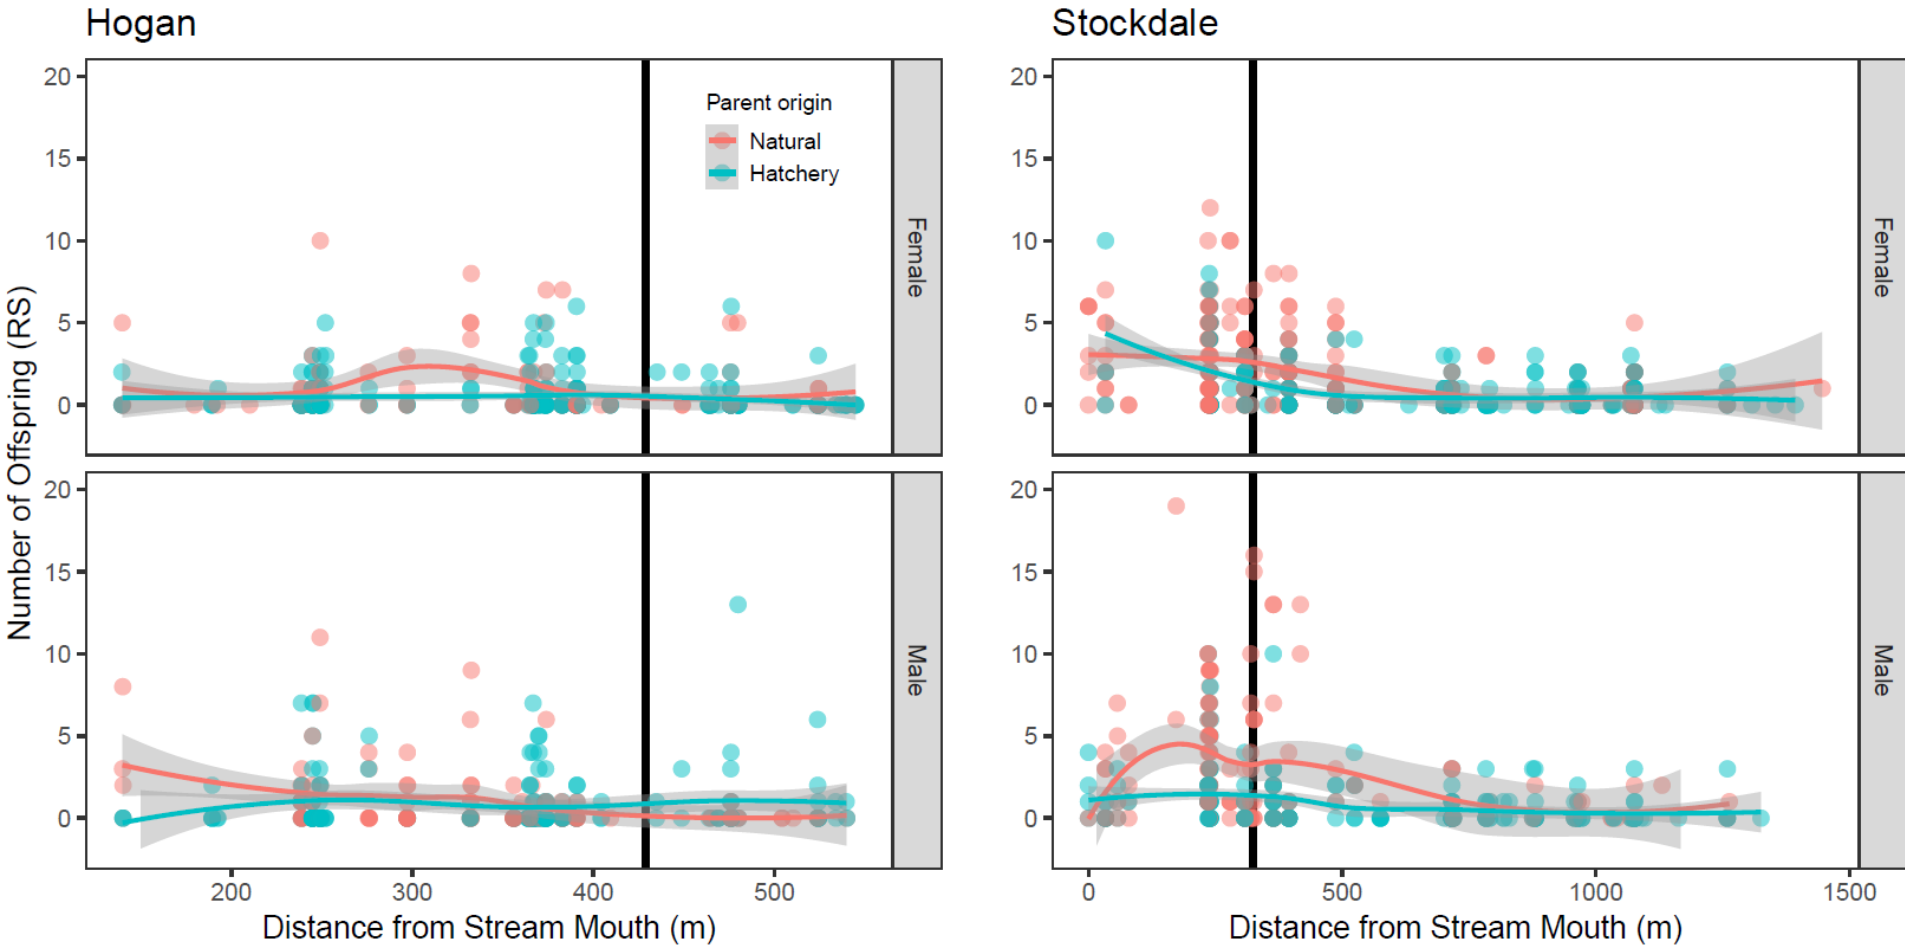

RS vs. Sample Date (2014/2016)

RS is higher early and late in the season for Stockdale...
but not for hatchery fish

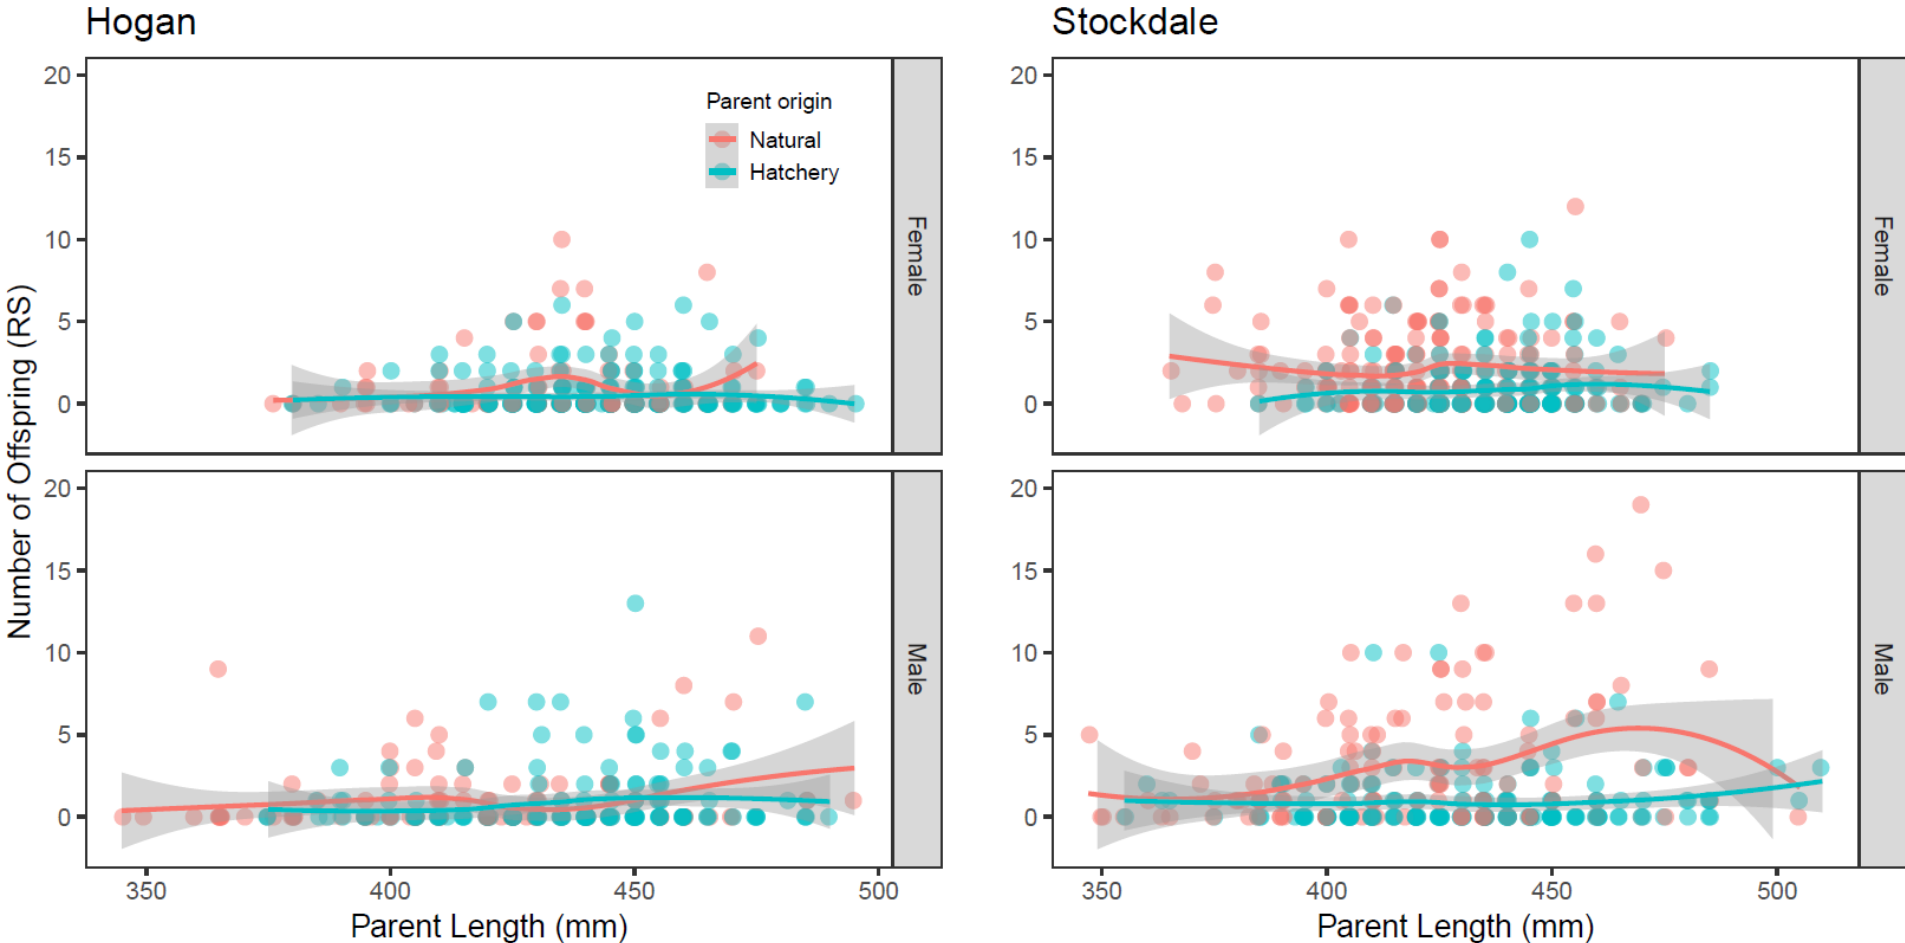

Figure 4 – Shedd et al. 2022

RS vs. Sample Location (2014/2016)

RS is higher near the intertidal in Stockdale

RS vs. Body Length (2014/2016)

RS is higher for larger males in Stockdale...
but not for hatchery fish

Figure 6 – Shedd et al. 2022

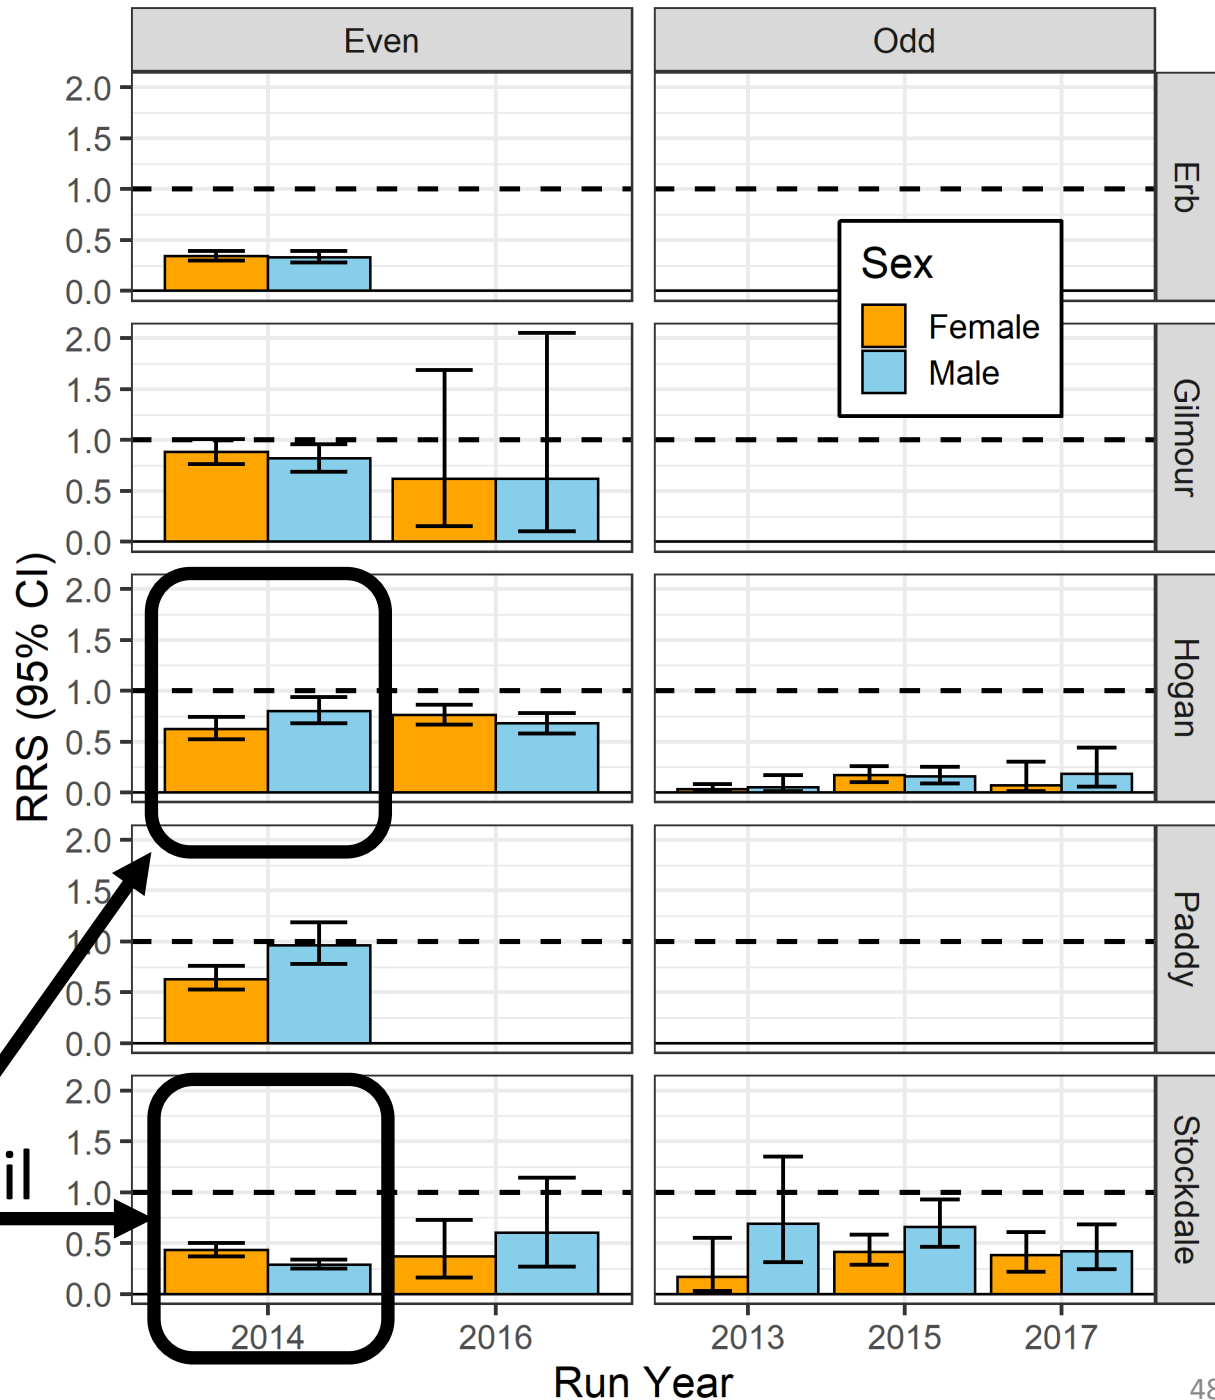

Accounting for Phenotypic Differences

- Differences between hatchery/natural
 - Body length
 - Sample date (run timing)
 - Sample location (within a stream)
- Correlated with number of offspring (RS)
- Generalized linear models (GLM)
 - Origin - RRS \sim 42-60%

Summary of RRS to Date

128K samples analyzed

$$RRS = \frac{\overline{RS}_{\text{Hatchery}}}{\overline{RS}_{\text{Natural}}}$$

Results shown in detail on previous slides

Parent-Offspring Duos

Natural Hatchery

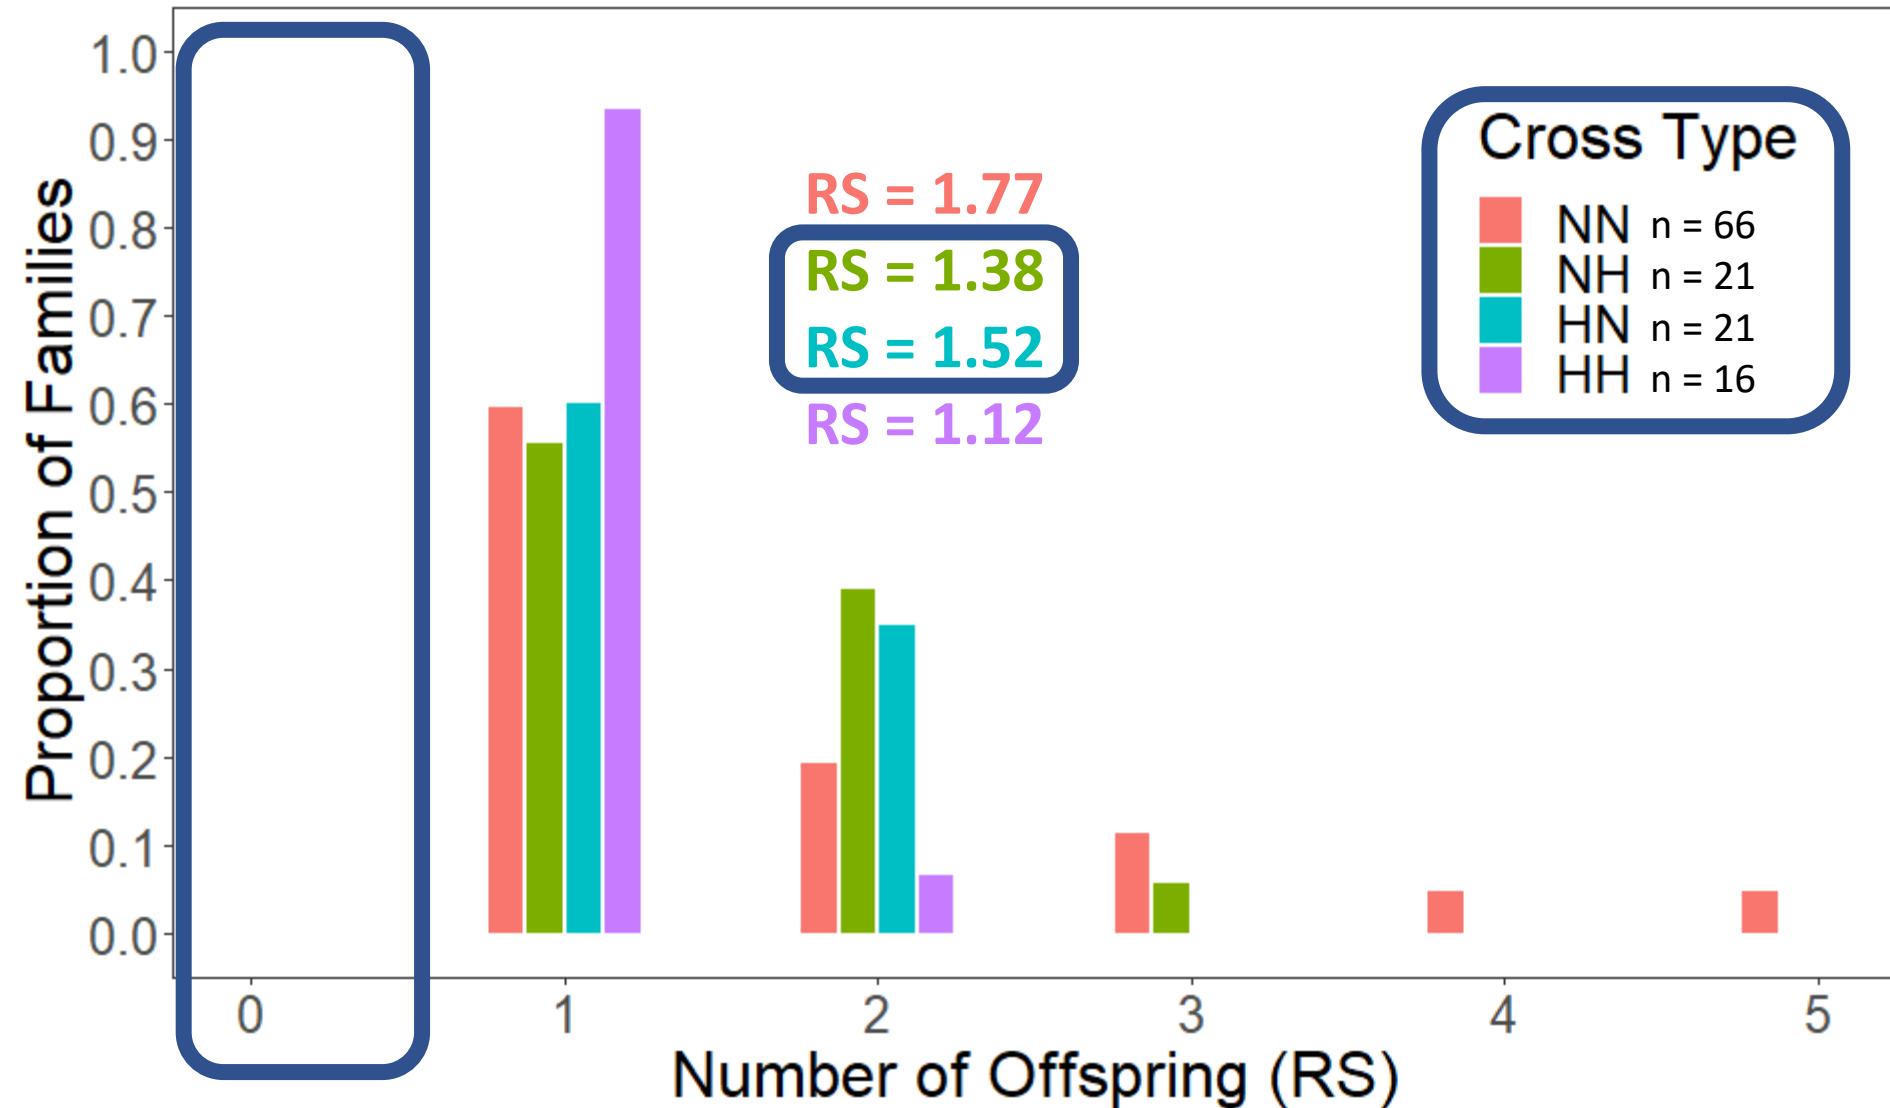

Parent-Offspring Trios

Natural **Hatchery**

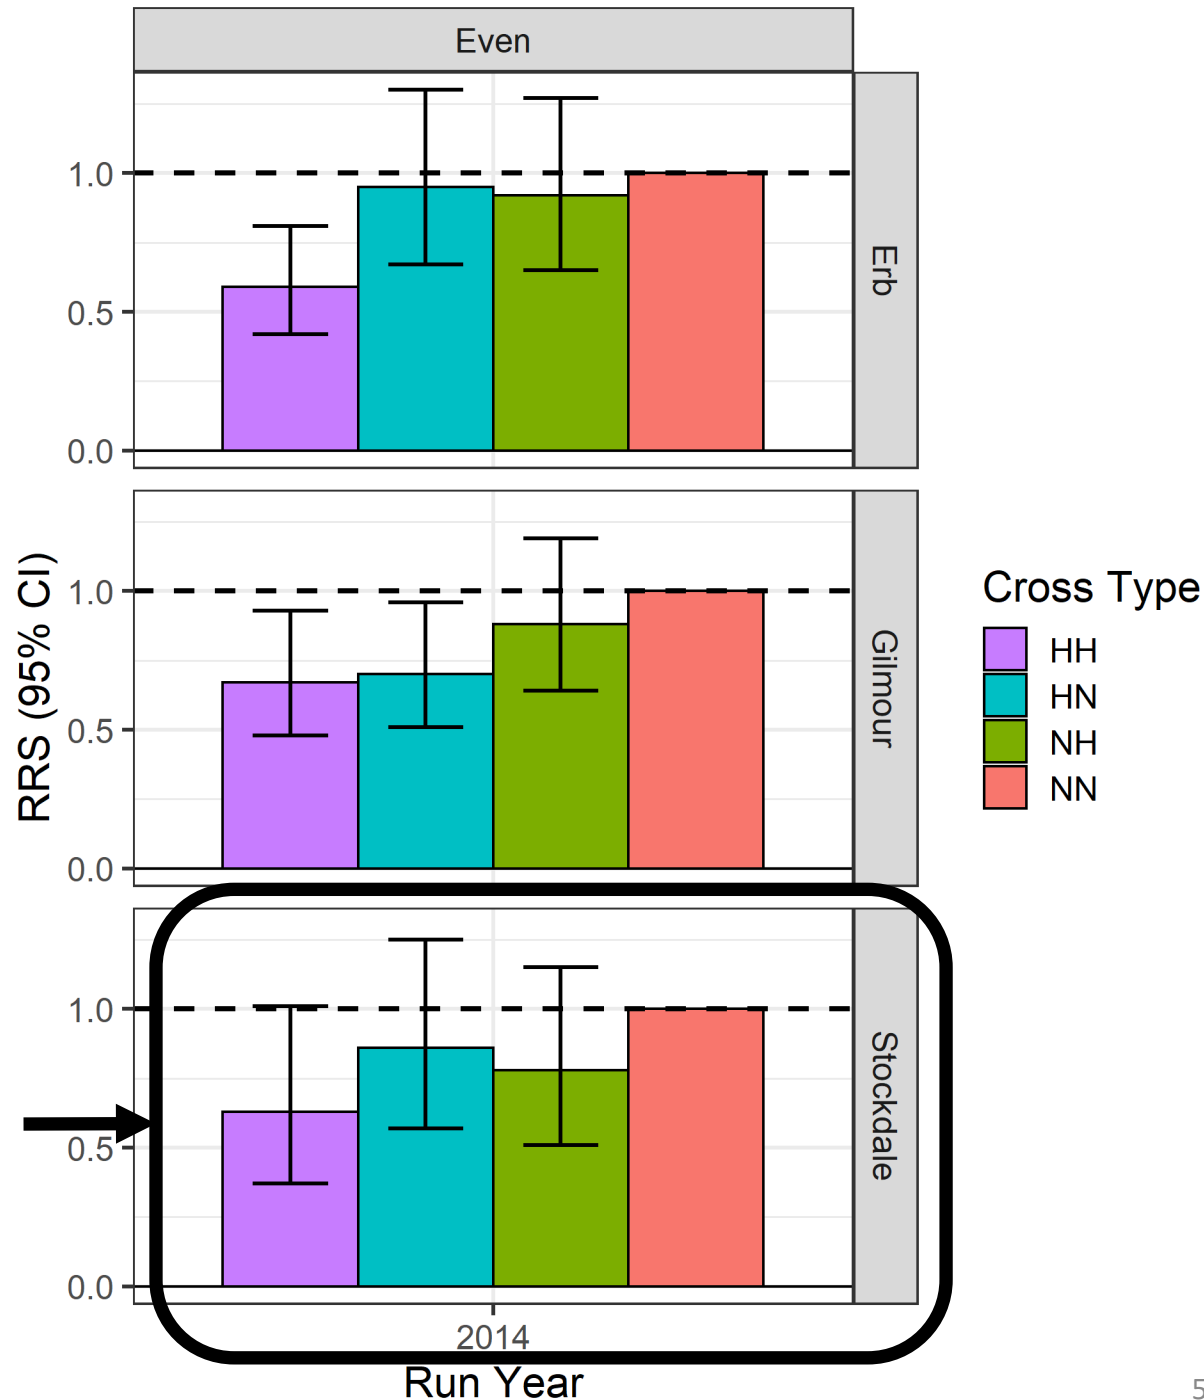

RS Distribution: Stockdale 2014/2016

Summary of RRS to Date

Limited to $n_{\text{family}} > 15$

$$\text{RRS} = \frac{RS_{XX}}{RS_{NN}}$$

Results show in detail on previous slides

Conclusions

- Hatchery-origin strays spawn in streams
- Stray hatchery-origin RRS < 1
- Variability in RRS (streams, years, sexes)
- Body size, sample date, sample location matter...
- But stray hatchery-origin RRS still < 1
- Hybrids had intermediate RRS

Remaining Questions

- Are observed reductions in hatchery-origin RRS an artifact of the study design?
 - Returning adults that are harvested?
 - Returning adults that stray to other streams?
 - Sampling proportion through time?
 - Both possible, but unlikely to fully explain our results
- Are results consistent in other streams and years?
 - Yes, RRS consistently < 1, but lots of variation
- Do hatchery/natural hybrids consistently produce fewer offspring than two natural-origin pink salmon?
 - Yes, on average
- Are reductions in fitness persistent across generations (grand-offspring and beyond)?
 - We do not know yet

A large group of salmon swimming in a river, with one fish in the foreground having its mouth wide open. The fish are densely packed, and the water is clear, showing the rocky riverbed. The salmon have various colors, including silvery, brown, and blue. The word "Questions?" is overlaid in large white text in the center of the image.

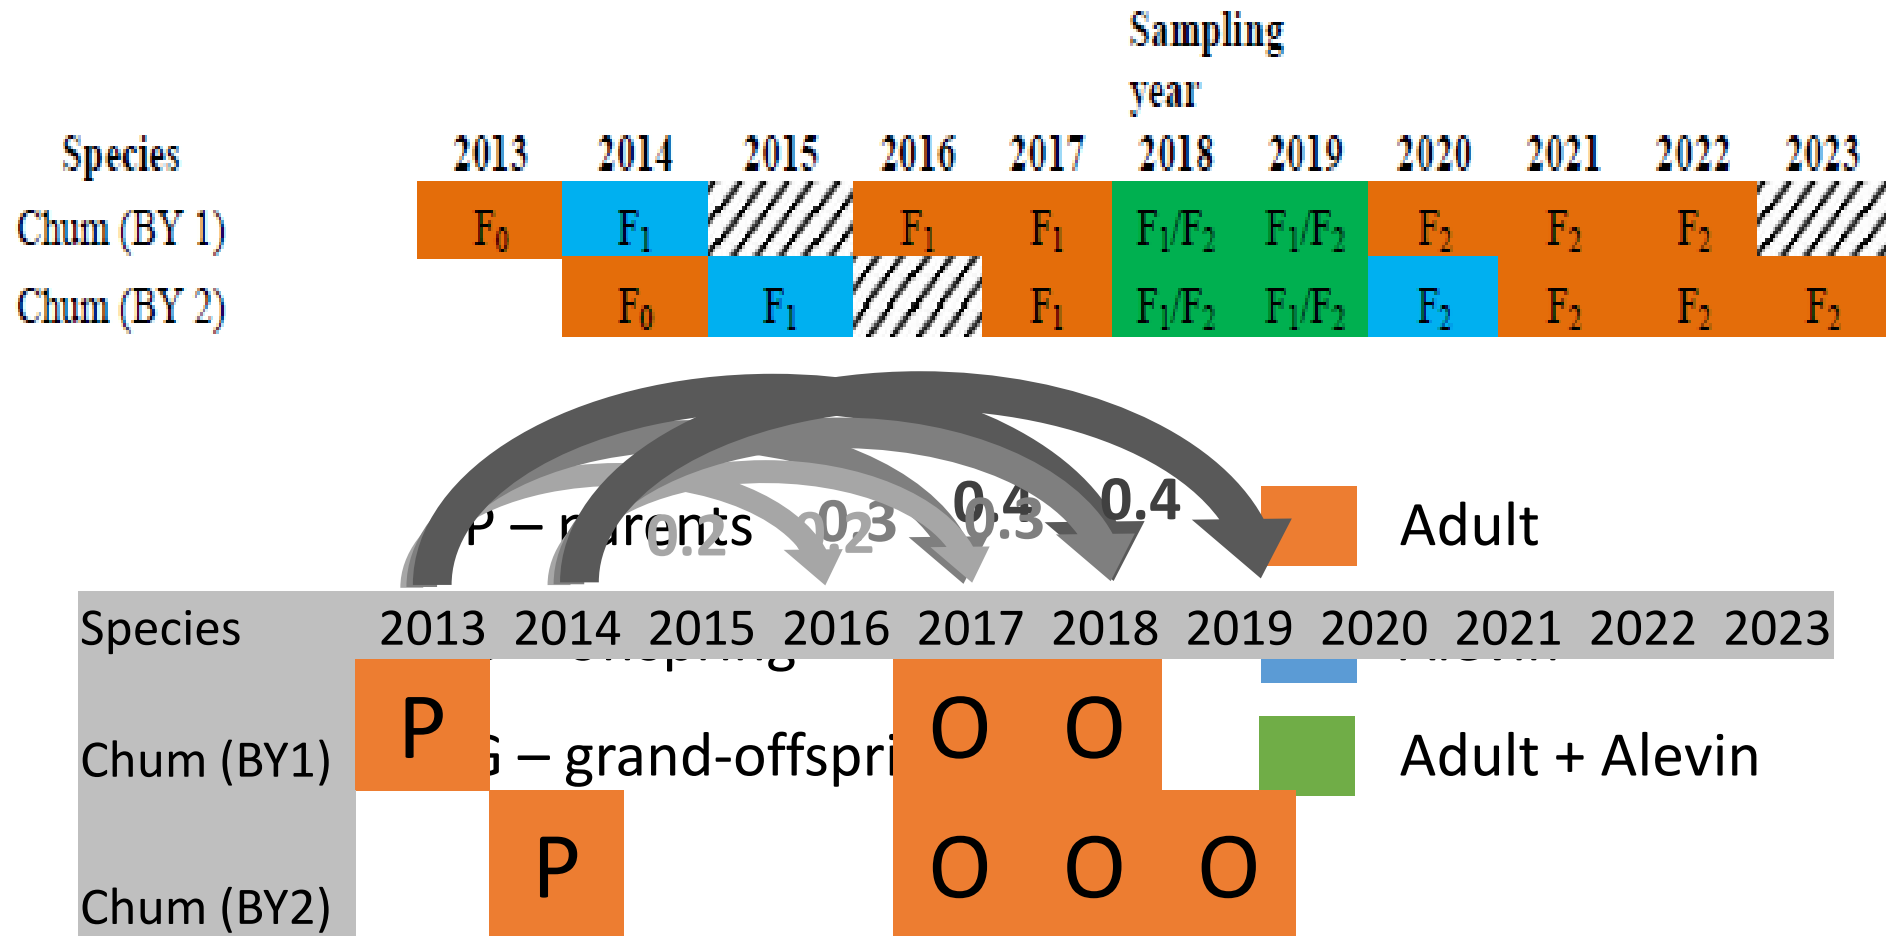

Questions?

AHRP Fitness Study: SEAK Chum Salmon

AHRP Streams in SEAK

Study Design: Original

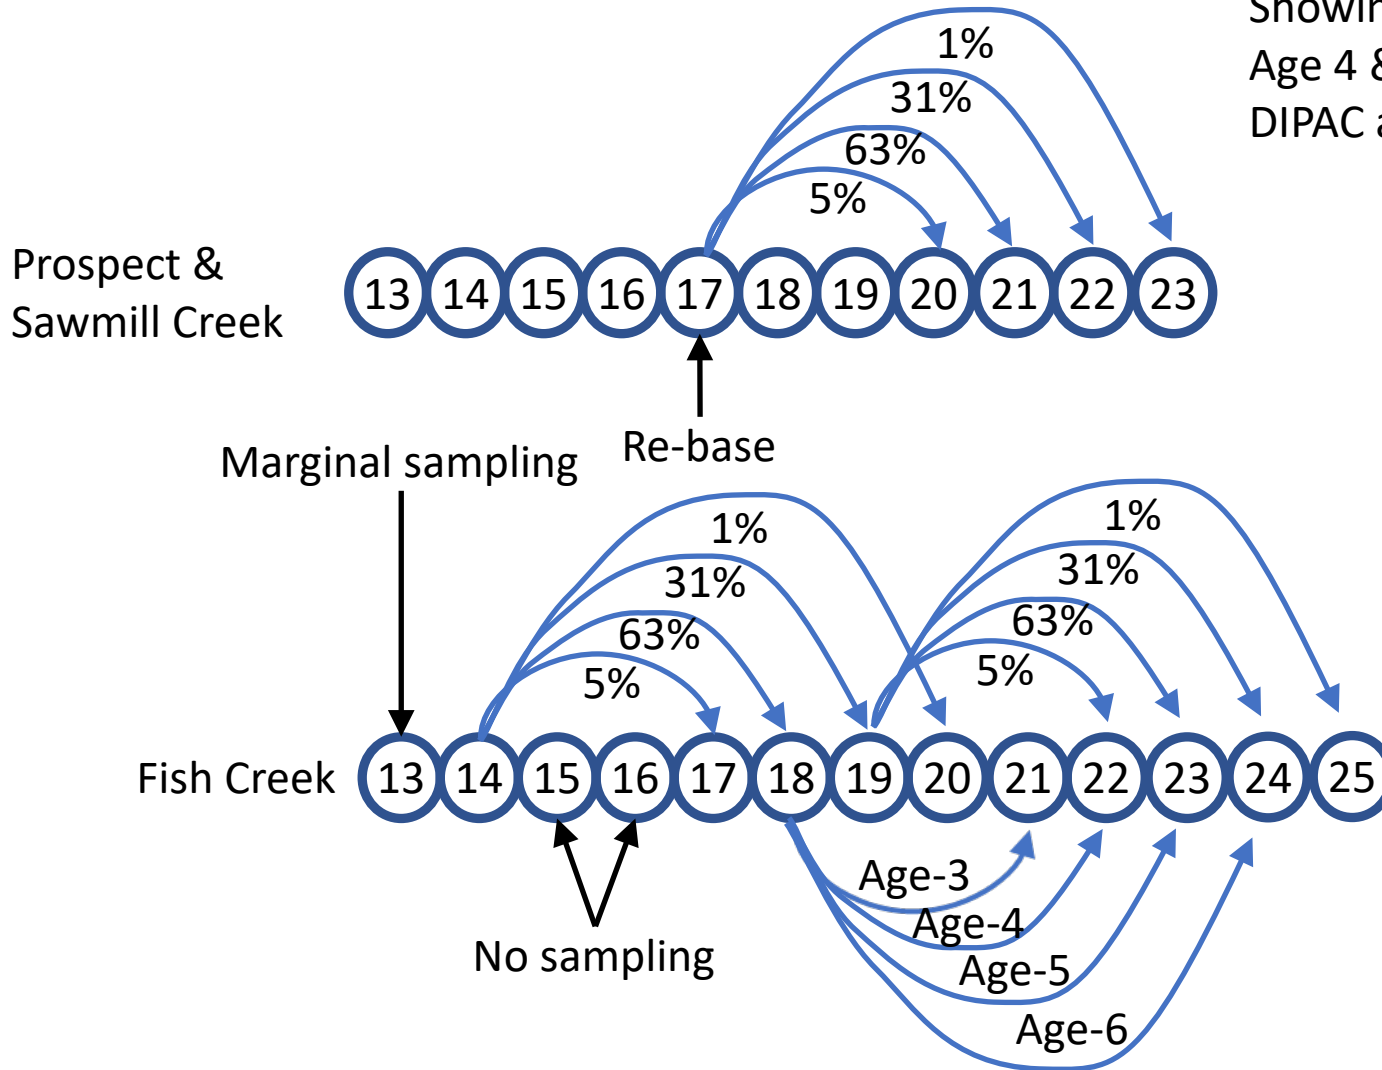

Samples Collected to Date

Study Design: Revised

Showing returns age 3 to 6
Age 4 & 5 are most common
DIPAC average 1989-2020

Remaining Work

- Field sampling in 2022 & 2023
- Design genetic markers for parentage
- Genotype samples
- Parentage analysis
- Calculate RRS
- GLM to account for length, date, and location
